

FlixInvite

Business Case: Netflix-Style Personalized Wedding Website Platform (Multi-Tenant SaaS)

Prepared: August 2026

1. Executive Summary

FlixInvite is a proposed multi-tenant SaaS product that generates a personalized, Netflix-styled website for each couple's wedding (subdomain.flixinvite.com), combining a viral, screen-recordable visual concept with the practical features Indian wedding couples already expect from category leaders like Zola, WithJoy, and India-specific players such as Anvaya, Shaadify, and Indivites. The core insight from market research: the base 'pretty wedding website' is a commodity given away free by every major competitor, so monetization must come from the novelty/virality layer plus paid add-ons (custom domain, guest management at scale, multilingual/WhatsApp tooling, and premium media/design), sold as a low one-time or seasonal fee rather than an ongoing subscription.

2. Market Research Findings

2.1 Market Size & Timing

- India's wedding economy is valued at approximately \$130B / █6.5 lakh crore annually, ~3% of India's GDP, with the 2025-26 wedding season alone accounting for ~46 lakh weddings.
- The Nov-Jan peak wedding season is the single highest-intent purchase window; couples actively search for a website 2-4 months before the date, matching your product-market timing thesis.
- Despite this scale, India's wedding-tech sector is highly fragmented — 1,500+ startups sharing only ~\$70M in cumulative funding, indicating low barriers to entry but also weak brand consolidation (opportunity for a distinctive, viral product to break through).

2.2 Competitive Landscape

Global leaders (Zola, WithJoy, The Knot, Minted, Joy) all offer the core website + RSVP + guest list + registry stack for free, monetizing via registry commissions, stationery, and premium domains/add-ons. India-specific players (Anvaya, Shaadify, Indivites, TheCuratedKnot, Lagnpatrika, Ayozan) differentiate on multi-event support, WhatsApp-native sharing, and regional-language personalization — features Western tools largely lack ('fail the uncle test').

Platform	Model	Strength	Gap
Zola / WithJoy / The Knot	Free site + registry commission	All-in-one, polished, integrated RSVP+registry	Generic design; weak for multi-event Indian weddings
Anvaya / Shaadify / Indivites	Freemium, India-focused	Multi-event (mehendi/sangeet/haldi), WhatsApp RSVP	Templated look, not shareable/viral by design
Lagnpatrika / Ayozan	Low one-time fee (█999+)	Regional language, animated e-invites	Invite-card focus, thin website/RSVP depth
FlixInvite (proposed)	Freemium subdomain + paid add-ons	Netflix-style virality, media-first storytelling, dynamic per-tenant build	New entrant, no brand trust yet

2.3 What Guests & Couples Actually Need (Table-Stakes Features)

- Multi-event pages — mehendi, haldi, sangeet, ceremony, reception — each with its own schedule, dress code, venue and RSVP (identified as the #1 scoring criterion for Indian weddings).
- Per-event, per-guest RSVP logic — guests answer per ceremony (e.g. sangeet yes, haldi no) rather than one blanket yes/no, with live dashboard counts for the couple.

- WhatsApp-native sharing — ~90% of Indian wedding guests receive the link via WhatsApp; broken link previews effectively make a site invisible.
- Regional language & personalized invites — Hindi, Tamil, Telugu, Marathi, Gujarati, etc., often with guest's name auto-rendered in-language via AI transliteration.
- Guest list management at scale (500+ guests), meal preference/dietary tracking, accommodation and travel info, and registry/cash-gift (Shagun) links.
- Custom domain and password-protected pages as premium upsells above the free tier.

3. FlixInvite Feature Set

3.1 Core (Free Tier) — the viral hook

- Dynamic app naming per tenant (e.g. 'SharmaFlix') generated from a config file — no hardcoded branding.
- Netflix-style hero banner, horizontally scrollable 'episode' rows auto-generated by scanning a /video-store and /thumbnails folder structure per couple.
- Click-to-open modal per memory/event with video playback, description, date and location — mirrors Netflix's title-detail UX.
- Mobile-first, WhatsApp-preview-optimized (correct Open Graph tags so the link unfurls with a poster image, not a broken preview).
- Single wedding-day RSVP with guest name capture.

3.2 Paid Add-Ons (monetization layer)

Add-on	What it does	Indicative Price
Custom domain	yourname.wedding instead of subdomain.flixinvite.com	■499/yr
Multi-event mode	Separate rows/pages + RSVP per ceremony (mehendi, sangeet, haldi, reception)	■999 one-time
Multilingual invites	Hindi/Tamil/Telugu/Marathi/Gujarati toggle with name transliteration	■499 one-time
WhatsApp guest RSVP + reminders	Personalized invite links sent via WhatsApp with automated reminders	■799 one-time
Extended media storage	More video/photo folders beyond free quota, HD hosting	■299–■999 tiered
Locked/Secret Letter page	Passcode-protected page for a private message	■149 one-time
Registry / Shagun link	Cash gift or registry integration	Free + small transaction fee
Premium theme packs	Alternate visual themes beyond Netflix (Prime Video, Spotify-Wrapped style, etc.)	■299 each

3.3 Technical Architecture (Simple & Performant)

- Next.js multi-tenant app resolving subdomain -> tenant config.json at request time (middleware-based routing).
- Content sourced from per-tenant /video-store and /thumbnails folders (or cloud storage bucket per tenant), auto-generating poster rows by folder name — no CMS/DB required for v1.
- Static generation (ISR) per tenant for near-zero hosting cost per site; lazy-loaded media for performance.
- Wildcard DNS + automated subdomain provisioning on signup/payment (Vercel or similar) to keep onboarding self-serve.

4. Go-To-Market Strategy

- Primary channel: short-form video (Instagram Reels/YouTube Shorts) showing the build/reveal — same channel that generated this concept; low CAC, naturally viral, and targets couples in the active planning window.
- Seasonal launch timing: push hardest in Sep-Oct ahead of the Nov-Jan wedding season peak identified in market data.
- Freemium funnel: free branded subdomain drives signups and shares; paid add-ons (custom domain, multi-event, multilingual, WhatsApp RSVP) are the actual revenue engine, mirroring Zola's free-site-plus-commission model.
- Referral loop: every shared wedding site is passive marketing to hundreds of guests, many of whom are themselves future customers — an inherent advantage of the wedding-website category.
- Vendor partnerships: bundle offers with wedding planners, photographers, and invitation designers who already touch the same customer at the same time.

5. Financial View (Illustrative)

Scenario	Couples/Season	Avg. Revenue/Couple	Season Revenue
Conservative	500	■800	■4.0 lakh
Base case	2,000	■1,200	■24 lakh
Upside (viral)	8,000	■1,500	■1.2 crore

Assumptions: near-zero marginal hosting cost per tenant (static generation + wildcard subdomains), no paid ad spend (organic/social-driven acquisition), and revenue mix weighted toward the ■499-999 add-ons rather than a single flat price. This is a seasonal, high-margin side-revenue product rather than a durable year-round SaaS unless expanded into adjacent occasions (anniversaries, birthdays, baby showers) to smooth demand outside wedding season.

6. Risks & Mitigations

- Commoditized core feature — mitigate by leaning entirely into the Netflix-style visual novelty as the wedge, not competing on RSVP/registry depth alone.
- Seasonality concentrates revenue in a 3-4 month window — mitigate by expanding the same engine to anniversaries, birthdays, and baby showers post-launch.
- Low switching cost / copycat risk once the format is public (as this reel already shows) — mitigate via speed to market and brand/community building this wedding season.
- Trust/new-entrant risk vs. established free platforms — mitigate with a generous free tier and vendor/photographer partnerships for credibility.

7. Recommendation

Proceed with a lean, subdomain-based multi-tenant build for this wedding season, using the free tier purely as a viral/acquisition mechanism and monetizing through the add-on stack above. Treat this as a fast, low-capex seasonal product launch rather than a full SaaS company build-out — validate demand and pricing this season, then decide whether to invest further in a year-round platform (extending to anniversaries/other celebrations) based on actual conversion and word-of-mouth traction.
